APPLICATION NOTES & DIAGRAMS

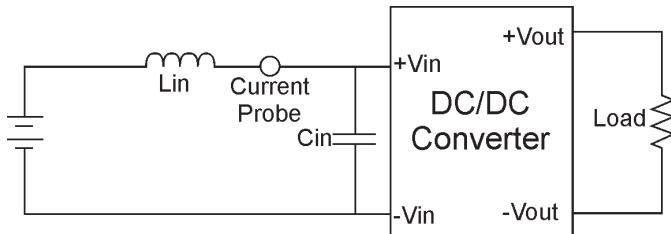

Derating Curve

TEST CONFIGURATIONS

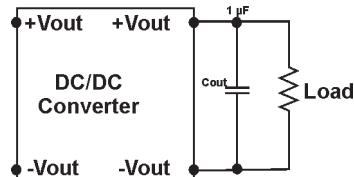

Input Reflected Ripple Current Test Step

Input reflected ripple current is measured through a source inductor Lin (12 μ H) and a source capacitor Cin (47 μ F, ESR<1.0 Ohm at 100 kHz) at nominal input and full load.

Output Ripple & Noise Measurement Test

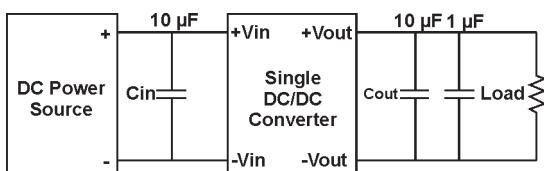

Use a 1.0 μ F ceramic disk capacitor at the output.

DESIGN & FEATURE CONFIGURATIONS

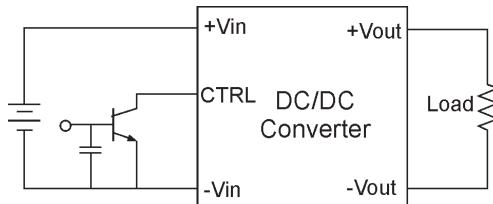

Output Ripple & Noise Reduction

To reduce ripple and noise, it is recommended to use a 1 μ F ceramic disk capacitor and a 10 μ F electrolytic capacitor at the output.

CTRL Module ON/OFF

Positive logic turns ON the module during high logic and OFF during low logic. Ctrl module on/off can be controlled by an external switch between the ctrl terminal and -Vin terminal. The switch can be an open collector or open drain. For positive logic if the ctrl feature is not used, please leave the ctrl pin floating.

Over Voltage Protection

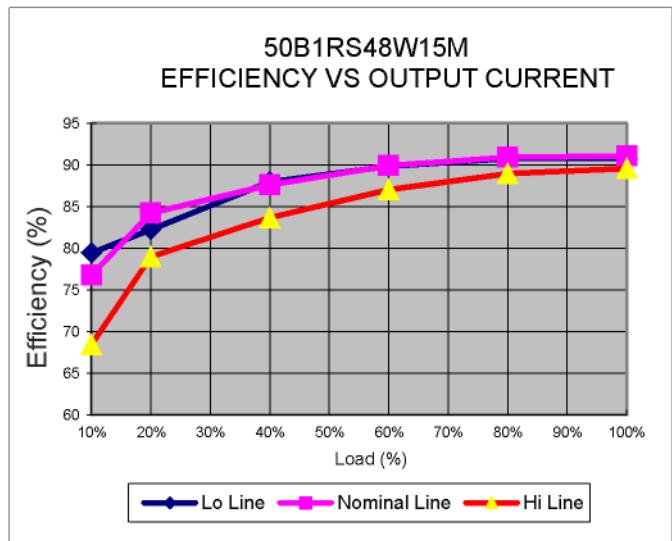

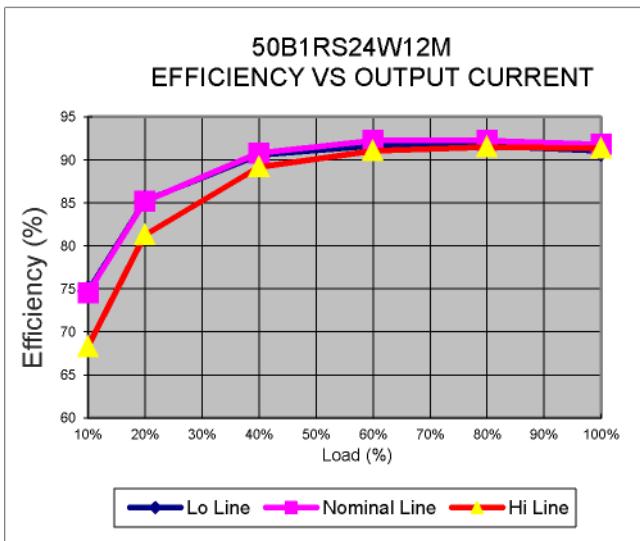

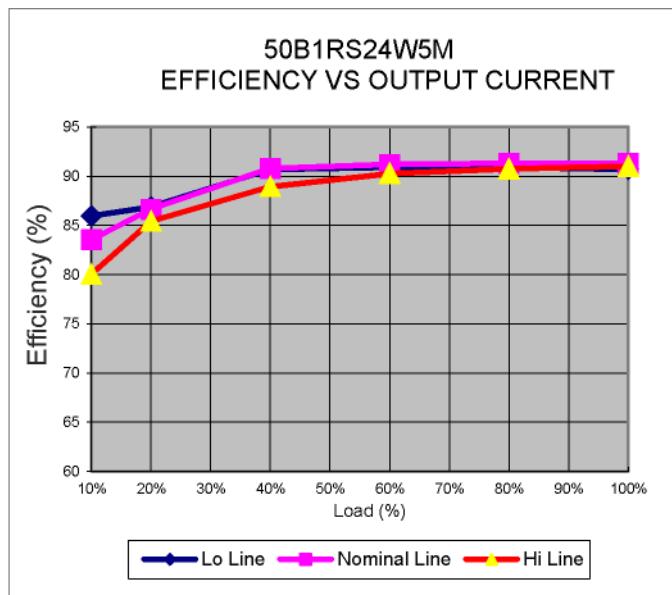

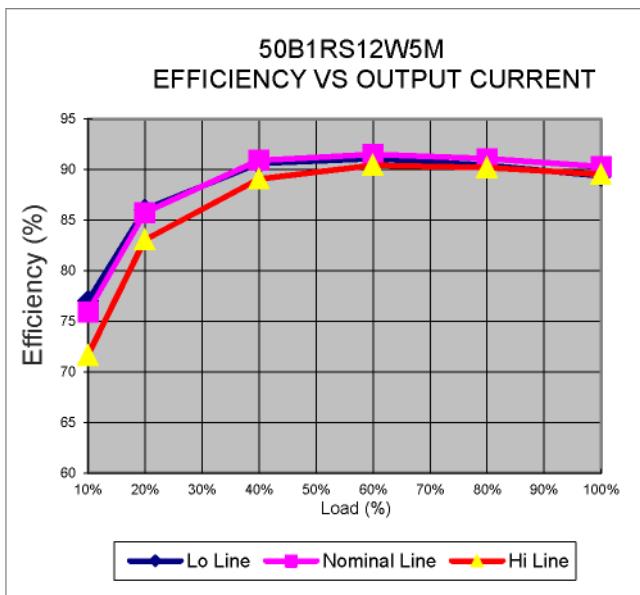

The module includes an internal output over voltage protection circuit, which monitors the voltage on the output terminals. If this voltage exceeds the over voltage set point, the module will activate the control loop of internal circuit to clamp the output voltage.

Over Current Protection

The module includes an internal over current protection circuit, which will endure current limiting for an unlimited duration during output over load condition. If the output current exceeds the OCP set point, the module will shut down automatically (hiccup). The module will try to restart after shut down. If the over load condition still exists, the module will shut down again.
